

Therapeutic Algorithm for Metastatic Disease

*In some cases, Ipi/Nivo combo is used as first line therapy. However, in PD-L1 positive tumors, single agent anti-PD1 (nivo or pembro) may be just as good as combination therapy, and thus is often used a single agent d/t fewer immune-related adverse effects. This is typically a conversation b/t physician and patient. This treatment algorithm is a fast-moving train is is being altered/updated on a recurring basis.
